The Effect of Eight Weeks of Core Stability and Short-Foot Exercises on Balance and Dynamic Foot Function in Taekwondo Athletes with Flexible Flat Feet

Protocol summary

Study aim

The effect of eight weeks of core stability training on single-leg balance in taekwondo athletes with flexible flat feet. The effect of eight weeks of short-leg training on single-leg balance in taekwondo athletes with flexible flat feet. The effect of eight weeks of core stability training on the dynamic leg performance of taekwondo practitioners with flexible flat soles. The effect of eight weeks of short leg training on the dynamic leg performance of taekwondo practitioners with flexible flat soles.

Design

The clinical trial has a control group with parallel groups and double-blind randomized phase 2 on 36 patients. This study will be experimental and will include three experimental groups, one group will be assigned to core stability exercises, another group will be assigned to core stability exercises with short legs and one group will be assigned to control.

Settings and conduct

Pre-test and post-test tests were conducted in the university's sports science laboratory and exercises were conducted inside the club's training facility.

Participants/Inclusion and exclusion criteria

People with flexible flat feet, or surgery on the lower limbs, spine, or pelvis in the past year were excluded from the study.For flat feet, after meeting the study entry criteria and being between 14 and 25 years old, the patient is examined with a navicular test and having a navicular drop of more than 10 mm.

Intervention groups

After dividing the subjects into 3 groups,In addition to the arch examination test, central stability exercises such as bridge with leg raises, abdominal exercises, lower body rotation, planks, bicycles, crunches, and weighted trunk rotations were performed for 8 weeks, three sessions per week.

Main outcome variables

Eight weeks of core stability and short leg training have an effect on single-leg balance and dynamic foot function in taekwondo athletes with flexible soles.

Scientific title

The Effect of Eight Weeks of Core Stability and Short-Foot Exercises on Balance and Dynamic Foot Function in Taekwondo Athletes with Flexible Flat Feet

Public title

The Effect of Eight Weeks of Core Stability and Short-Foot Exercises on Balance and Dynamic Foot Function in Taekwondo Athletes with Flexible Flat Feet

Purpose

Supportive

Inclusion/Exclusion criteria

Inclusion criteria:

flexible flatfoot

Exclusion criteria:

History of fractures and dislocation of foot hiatory of orthopedic surgury in the recent of three months infections of foot

Age

From **13 years** old to **23 years** old

Gender

Male

Phase

N/A

Groups that have been masked

- Participant
- Investigator

Sample size

Target sample size: **36**

Randomization (investigator's opinion)

Randomized

Randomization description

One group was assigned to core stability exercises, another group to core stability exercises with short foot, and a control group.

Blinding (investigator's opinion)

Double blinded

Blinding description

The researcher and the people in the training group do not know which group they are in.

Placebo

Health conditions studied

1

Description of health condition studied

Flexible flat foot

ICD-10 code

ICD-10 code description

Diseases of the musculoskeletal system and connective tissue

Primary outcomes

1

Description

Navicular bone loss of more than 10 mm

Timepoint

Start studying

Method of measurement

Balance measurement using the Y balance control device, dynamic performance measurement using the padoscan, and navicular drop measurement using a ruler's millimeter scale.

Secondary outcomes

empty

Intervention groups

1

Description

This study will include three experimental groups. The sample size was determined using G*Power software, and a total of 24 taekwondo athletes with flexible flat feet will be recruited. The study will be designed as a randomized controlled clinical trial with a pre-test–post-test design and a control group.The intervention program will last for eight weeks. Participants will be divided into three groups: a core stability training group, a combined core stability and short-foot exercise group, and a control

group.

Category

Rehabilitation

2

Description

Core stability training will consist of trunk-specific exercises such as various types of plank exercises. Balance will be assessed using the Y-Balance Test, while dynamic foot function and plantar pressure distribution will be evaluated using Footscan and Podoscan systems.Participants in the experimental groups will undergo an eight-week corrective exercise intervention, whereas the control group will not receive any specific intervention. After completing all assessments, the testing procedures will be repeated at the end of the eight-week period, and the post-test results will be recorded and analyzed as outcome data for comparison with the pre-test measurements.

Title and more details about the data/document

Only part of the data, such as information related to the main outcome of the research topic, will be shared.

When the data will become available and for how long

Access begins from 1405 onwards.

To whom data/document is available

For people who will work in academic and sports institutions

Under which criteria data/document could be used

They can only use information from the data we mentioned in the research itself.

From where data/document is obtainable

By sending and receiving messages from the researcher's email

What processes are involved for a request to access data/document

After sending an email regarding the request, it will be received by the individuals after a month of review.
