The Effect of Eight Weeks of Upper Extremity Performance-Based Injury Prevention Exercises on Glenohumeral Joint Range of Motion and Functional Stability in Male Volleyball Players

Protocol summary

Study aim

The effect of eight weeks of shoulder injury prevention training on range of motion and performance of adolescent volleyball players.

Design

The clinical trial has an intervention group and a control group, , no blinding, simple randomization, phase zero on 60 volleyball players, which used the rand function of Excel software for randomization.

Settings and conduct

"This study involves 60 volleyball players (30 males, 30 females) at Shahid Beheshti University gym. The intervention consists of an 8-week shoulder injury prevention program (3 sessions/week, 20 min/session) implemented during warm-ups. Shoulder ROM and upper limb function will be assessed using a goniometer and the Closed Kinetic Chain Upper Extremity Stability test, respectively

Participants/Inclusion and exclusion criteria

Inclusion criteria: At least 3 regular training sessions per week; no history of spine or upper limb surgery; 2 years of volleyball experience; age range 12-15 years
Exclusion criteria: Older and younger age range, unwillingness to continue the research, having organ damage

Intervention groups

The intervention of the present study is the Oslo Sport Trauma Research Center injury prevention exercises, which were designed by the Oslo Injury Prevention Research Center. These exercises will be performed for 8 weeks and 3 sessions per week for 20 minutes as a shoulder warm-up protocol. In the control group, no intervention is performed and they continue with their normal program.

Main outcome variables

Primary outcomes include shoulder internal/external rotation range of motion, upper limb functional balance,

and sports injury incidence rate

Scientific title
The Effect of Eight Weeks of Upper Extremity Performance-Based Injury Prevention Exercises on Glenohumeral Joint Range of Motion and Functional Stability in Male Volleyball Players

Public title
Shoulder injury prevention exercises for volleyball players

Purpose
Prevention

Inclusion/Exclusion criteria
Inclusion criteria:
Having 3 regular training sessions per week
Age range 12 to 15 years
No history of spine or upper limb surgery
Experience in volleyball for 2 years
Exclusion criteria:
Older and younger ages
Unwillingness to participate in research
Having damage to the organs

Age
From **12 years** old to **15 years** old

Gender
Both

Phase
N/A

Groups that have been masked
No information

Sample size
Target sample size: **60**

Randomization (investigator's opinion)
Randomized

Randomization description
In this study, simple randomization method is used and the randomization unit is "individual". Random sequence is generated in Excel software using RAND function and MOD ROW function is used for grouping. In order to observe allocation concealment, each individual's allocation code is placed in illegible and sealed envelopes after being determined in Excel.

Blinding (investigator's opinion)
Not blinded

Blinding description

Placebo
Not used

Health conditions studied

1

Description of health condition studied

Preventing shoulder pain and injury

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

Range of motion

Timepoint

Before the intervention and eight weeks after the intervention

Method of measurement

360 degree goniometer

2

Description

Closed Kinetic Chain Upper Extremity Stability Test

Timepoint

Before the intervention and eight weeks after the intervention

Method of measurement

Closed Kinetic Chain Upper Extremity Stability Test: The hands should be placed on the bars in a push-up position, and then one hand should be lifted off the ground. While maintaining balance on one hand, the guiding hand should be lifted off the ground and approached and touched the hand bar on which it is resting. Then, return to the original push-up position and repeat the movement with the other hand.

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: The Oslo Sports Trauma Research Center Shoulder Injury Prevention Exercises are designed by the Oslo Sports Trauma Research Center to prevent shoulder injuries. The training group will use this protocol for warm-up for eight weeks, three sessions per week for 20 minutes. A goniometer will be used to measure the variables of shoulder internal and external rotation range of motion, and a closed-chain functional test will be used to assess performance in the pre-test and post-test.

Category

Prevention

2

Description

Control group: During the research period, there will be no intervention in the control group and they will do their usual exercises. Also, the range of motion of the shoulder internal and external rotation and the closed chain functional test will be measured in the pre-test and post-test.
