Investigating the Effectiveness of adding Transcranial Direct Current Stimulation (tDCS) to the Camperdown program on the Stuttering Severity index in Adults with Stuttering: A Randomized Double-Blind Clinical Trial

Protocol summary

Study aim

Objectives: The aim of this study is to investigate the effectiveness of tDCS stimulation along with conventional speech therapy in reducing the severity of stuttering in adults.

Design

The study is designed as a randomized clinical trial.

Settings and conduct

60 adults with stuttering from Golestan Hospital in Ahvaz will be randomly divided into two intervention and control groups. Both groups will be given conventional speech therapy, but the intervention group will also be given electrical stimulation with tDCS. In the control group, tDCS is provided in a sham and silent form. The duration of the intervention period is 8 sessions and a one-month follow-up period is considered for treatment follow-up.

Participants/Inclusion and exclusion criteria

Study inclusion and exclusion criteria: Adults with stuttering, age range 18 to 50 years, no metallic objects or abnormalities in the skull, Unwillingness to continue participating in the research.

Intervention groups

Intervention group: 30 adults with stuttering receiving speech therapy plus tDCS electrical stimulation
Control group: 30 adults with stuttering receiving speech therapy without tDCS electrical stimulation (sham tDCS)

Main outcome variables

Main outcomes: stuttering severity and stuttering-related quality of life.

Scientific title

Investigating the Effectiveness of adding Transcranial

Direct Current Stimulation (tDCS) to the Camperdown program on the Stuttering Severity index in Adults with Stuttering: A Randomized Double-Blind Clinical Trial

Public title

Effectiveness of adding Transcranial Direct Current Stimulation (tDCS) to the Camperdown program on the Stuttering Severity index in Adults

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Having developmental stuttering Having moderate to severe stuttering being Right-handed being Farsi-language Not receiving stuttering-related treatment in the past month prior to the start of the intervention

Exclusion criteria:

Having skin lesions or bone defects in the skull area Presence of other speech disorders with stuttering Taking brain-stimulating drugs Having metal implants in the skull

Age

From **18 years** old to **50 years** old

Gender

Both

Phase

N/A

Groups that have been masked

- Participant
- Outcome assessor
- Data analyser

Sample size

Target sample size: **40**

Randomization (investigator's opinion)

Randomized

Randomization description

Simple Randomized-block design Randomization will be performed by using Randomized-block design method through WINPEPI software as well as applying 4-block for each group. This software create a sequence of random numbers that is used to assign participants to one of the groups. The person who is responsible to make a random list will be blinded to participants.

Blinding (investigator's opinion)

Double blinded

Blinding description

Blinding of participants is done using a sham method. Assessor blinding: The assessor is unfamiliar with the name, gender, and grouping of the study subjects. Blinding of the data analyst: The assessor is unfamiliar with the name, gender, and grouping of the study subjects.

Intervention groups

1

Description

Intervention group:Electrical stimulation is provided using the Segal Stim AT-12 device from Pharmed Tajhiz Company, in tDCS mode. An electroencephalography cap will be used to identify the location of the stimulation, so the brain areas are designated on it with the international 10-20 system. Stimulation is performed by passing a current of 2 mA and a resolution of 0.1 mA between two 5 cm x 7 cm electrodes for 20 minutes.Simultaneously with the device's stimulation, a speech therapy program is presented at a slow and drawn-out pace.

Category

Treatment - Devices

2

Description

Control group: In the control group, the device's electrical current will increase to 2 mA for 15 seconds and then immediately turn off. Simultaneously with the device's stimulation, a speech therapy program is presented at a slow and drawn-out pace.
