The Effect of an 8-week Exercise Program Focused on Anticipatory postural Adjustments on Static and Dynamic balance in pre-fatigue and post-fatigue Elderly women

Protocol summary

Study aim

Investigating the Effect of Balance Exercises Focused on Anticipatory Postural Adjustments on Motor Performance, Quality of Life, and Balance Confidence in Older Women, Before and After Fatigue

Design

This study is a quasi-experimental pretest-posttest design with a control group. Participants were recruited through voluntary convenience sampling and, after baseline assessments, were allocated to intervention and control groups using matched-pair randomization generated by Random Allocation Software.

Settings and conduct

This study will be conducted on older women over 60 years of age residing in Isfahan, Iran. Participants will be recruited through voluntary convenience sampling from the elderly female population of Isfahan. After baseline assessments, participants will be allocated into intervention and control groups using matched-pair randomization. All outcomes were assessed in both groups before and after fatigue.

Participants/Inclusion and exclusion criteria

Inclusion criteria include age ≥ 60 years, completion of informed consent, and absence of medical or ethical contraindications to participate in exercise. Exclusion criteria include failure to complete the assessments, absence from more than one-third of the 8-week training sessions (more than 8 sessions), or presence of lower limb length discrepancy.

Intervention groups

Intervention group: Older women >60years performing 8 weeks of balance training focused on anticipatory postural adjustments. Control group: Older women (>60 years) receiving no intervention during the study period.

Main outcome variables

The primary outcome is the change in static balance (Functional Reach Test), dynamic balance (Timed Up and

Go test), and quality of life (SF-36 questionnaire) in older women before and after the training intervention and under pre- and post-fatigue conditions.

Scientific title

The Effect of an 8-week Exercise Program Focused on Anticipatory postural Adjustments on Static and Dynamic balance in pri-fatigue and post-fatigue Elderly women

Public title

The Effect of an 8-week Exercise Program Focused on Anticipatory postural Adjustments on Static and Dynamic balance in pri-fatigue and post-fatigue Elderly women

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

No medical or ethical contraindications for participating in the exercises (including visual, auditory, cardiopulmonary, communicative, etc.) Minimum age of 60 years Completion of the informed consent form

Exclusion criteria:

Absence of leg length discrepancy Failure to complete the tests and participate in the training sessions (The training program is designed for an 8-week period with 3 sessions per week, totaling 24 one-hour sessions. Participants who miss more than one-third of the sessions—i.e., 8 sessions—for any reason will be excluded from the study.)

Age

Randomization (investigator's opinion)

Randomized

Randomization description

The participants were first matched based on weight and height. Each matched pair was then randomly allocated to one of the two groups using block randomization and random sequences generated by the Random Allocation Software. The allocation process was conducted by an independent individual to minimize allocation bias.

Health conditions studied**1****Description of health condition studied**

Age-related balance impairment in older women

ICD-10 code**ICD-10 code description**

Age-related balance impairment in older women

Primary outcomes**1****Description**

Static Balance: The ability to maintain static balance in older women.

Timepoint

Before the start of the intervention and after the 8-week intervention period, assessed under both pre-fatigue and post-fatigue conditions.

Method of measurement

Assessed using the Functional Reach Test. The maximum forward reach distance without stepping is measured, and the difference between the initial and maximal reach positions is recorded in centimeters.

2**Description**

Dynamic Balance: The ability to maintain balance during movement and mobility.

Timepoint

Before the intervention and after completion of the intervention, under both pre-fatigue and post-fatigue conditions.

Method of measurement

Assessed using the Timed Up and Go (TUG) test. The time required to stand up from a chair, walk 3 meters,

turn, walk back, and sit down is recorded in seconds.

3

Description

Quality of Life: Health-related quality of life in older women.

Timepoint

Before the intervention and after the completion of the 8-week intervention.

Method of measurement

Assessed using the validated SF-36 questionnaire, which evaluates multiple domains of quality of life and provides a score ranging from 0 to 100.

Secondary outcomes

2

Description

Intervention group: Elderly women aged over 60 years participated in an 8-week exercise program focusing on enhancing the anticipatory postural adjustment mechanism of balance control. Training was performed three sessions per week, with each session lasting 60 minutes (10 minutes warm-up, 40 minutes main exercises, and 10 minutes cool-down). The main exercises consisted of ball throwing and catching tasks with progressive manipulation of variables such as throwing distance, direction, type of throw, ball weight, and body posture (changes in base of support). The program was progressively designed to challenge anticipatory balance mechanisms and improve motor function and balance control in older adults.
