Comparison of the effects of modified exercise protocols based on self-natural posture exercises (SNPE) and dynamic neuromuscular stabilization (DNS) on posture, profile fitness mapping back questionnaire and lumbar kinematic in female employees with lower crossed syndrome.

Protocol summary

Study aim

Comparison of the effects of modified exercise protocols based on self-natural posture exercises (SNPE) and dynamic neuromuscular stabilization (DNS) on posture, profile fitness mapping back questionnaire and lumbar kinematic in female employees with lower crossed syndrome.

Design

42 female employees with LCS who are divided into three groups using the cluster method. two groups are the experimental and the other group is the control. Using GPower software and considering an effect size of 0.45, alpha of 0.05, and power of 0.80, 13 people were calculated for each group, and with an added margin of safety, 14 people in each group, totaling 42 people, will be considered as the research sample.

Settings and conduct

After identifying employees with lower crossed syndrome and having the consent form by volunteers, they attended the Vaght Zendegi sport club at specified hours and performed exercise sessions under the supervision of the respective trainer.

Participants/Inclusion and exclusion criteria

Entry Criteria: Being female, Lower cross syndrome, Having a history of mild to moderate low back pain, Absence of serious musculoskeletal diseases, Having an office job and sitting at a desk

Intervention groups

After dividing the participants into 3 equal groups using the cluster method, the first experimental group is given DNS exercises according to a specific protocol, 3 days a week for 8 weeks. The second group is also given modified SNPE according to a specified protocol, 3 days a week for 8 weeks, and for the control group, all ethical

considerations will be taken into account after the completion of the study.

Main outcome variables

the measurement of lumbar lordosis (measured by a flexible ruler) and pelvic tilt (tilt meter) and the Matthias test; the PFM questionnaire; lumbar region kinematics from the sagittal view (squat movement) are all examined as pre-test and post-test.

Scientific title

Comparison of the effects of modified exercise protocols based on self-natural posture exercises (SNPE) and dynamic neuromuscular stabilization (DNS) on posture, profile fitness mapping back questionnaire and lumbar kinematic in female employees with lower crossed syndrome.

Public title

Comparison of the effects of two exercise protocols on posture, profile fitness mapping back questionnaire and lumbar kinematic.

Purpose

Supportive

Inclusion/Exclusion criteria

Inclusion criteria:

being a woman lower crossed syndrome Having a history of mild to moderate low back pain Having an office job and sedentary work

Exclusion criteria:

serious musculoskeletal diseases

Age

No age limit

Gender

Female

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: 42

Randomization (investigator's opinion)

Randomized

Randomization description

First, participants will be selected using a cluster sampling method. Then, 42 eligible female employees will be randomly allocated in a 1:1:1 ratio to the SNPE, DNS, and control groups using a random number table. The randomization sequence will be generated by a researcher not involved in participant assessment, and group allocation will be concealed using sealed, numbered envelopes.

Blinding (investigator's opinion)

Not blinded

Health conditions studied

1

Description of health condition studied

lower crossed syndrome

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

lumbar posture

Timepoint

Before intervention and immediately after the 8-week intervention

Method of measurement

Lumbar lordosis angle using a flexible ruler and pelvic tilt using a tilt meter and the Matias test

2

Description

Profile Fitness Mapping Back Questionnaire Score

Timepoint

Before intervention and immediately after the 8-week intervention

Method of measurement

Functional readiness will be assessed using the Profile Fitness Mapping BackQuestionnaire.

3

Description

Lumbar kinematic from the sagittal view
Timepoint
Before intervention and immediately after the 8-week intervention
Method of measurement
squat test

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: Participants will perform a modified SNPE exercise program for 8 weeks, 3sessions per week, 60 minutes per session. Exercises include corrective,stretching, strengthening and syndrome-specific movements.

Category

Rehabilitation

2

Description

Intervention group:Participants will perform a DNS exercise program for 8 weeks, 3 sessions perweek, 60 minutes per session. The program includes developmental movementpatterns, core activation and neuromuscular stabilization exercises.

Category

Rehabilitation

3

Description

Control group:Participants in the control group will continue their routine daily activities and willnot receive any specific exercise intervention
