Evaluating the Impact of Diaphragm Manual Release Combined with Upper Trapezius Myofascial Release on Mechanical Neck Pain and Active Trigger Points: A Randomized Controlled Trial

Protocol summary

Study aim

To evaluate the effect of adding diaphragm manual release to upper trapezius myofascial release on pain, disability, pressure pain threshold, cervical range of motion, chest expansion, and patient-reported improvement in individuals with chronic mechanical neck pain.

Design

Parallel-group randomized controlled trial with simple randomization. Participants will be allocated equally into two groups. Outcome assessment will be performed by a blinded assessor.

Settings and conduct

Participants will be recruited from physiotherapy and rehabilitation clinics. Eligible participants will provide informed consent before enrollment. Treatments will be delivered by trained physiotherapists over four weeks.

Participants/Inclusion and exclusion criteria

Adults aged 18–55 years with chronic mechanical neck pain (>3 months) and at least one active upper trapezius trigger point will be included. Exclusion criteria include cervical trauma or surgery, neurological or respiratory disorders, radicular pain, pregnancy, and recent participation in other neck pain interventions.

Intervention groups

Group A: Upper trapezius myofascial release only. Group B: Upper trapezius myofascial release combined with diaphragm manual release. Both groups will receive treatment three times weekly for four weeks.

Main outcome variables

Primary outcomes: Pain intensity (NPRS) and Neck Disability Index (NDI). Secondary outcomes: Pain Pressure Threshold (PPT), cervical range of motion, chest expansion, and Patient Global Impression of Change (PGIC). Outcomes will be measured at baseline and after treatment.

Scientific title

Evaluating the Impact of Diaphragm Manual Release Combined with Upper Trapezius Myofascial Release on Mechanical Neck Pain and Active Trigger Points: A Randomized Controlled Trial

Public title

Effect of Diaphragm Manual Release Combined with Upper Trapezius Myofascial Release in Patients with Mechanical Neck Pain

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Age 18–55 years. Mechanical neck pain for more than 3 months NPRS between 30–80 mm At least one active upper trapezius trigger point BMI 18.5–29.9. Ability to attend treatment sessions Ability to understand questionnaires.

Exclusion criteria:

Cervical trauma or surgery Neurological disorders Respiratory disorders Radicular pain Pregnancy Recent neck pain intervention Inability to complete assessments

Age

From **18 years** old to **55 years** old

Gender

Both

Phase

N/A

Groups that have been masked

- Outcome assessor

Sample size

Target sample size: **28**

Randomization (investigator's opinion)

Randomized

Randomization description

Eligible participants will be randomly allocated into two groups in a 1:1 ratio. Randomization will be performed using a computer-generated random sequence with allocation concealment through sequentially numbered opaque sealed envelopes prepared by an independent researcher.

Blinding (investigator's opinion)

Single blinded

Blinding description

Outcome assessments will be performed by an independent physiotherapist who is blinded to group allocation. The assessor will not participate in treatment sessions and will remain unaware of the intervention received by participants.

Placebo

Not used

Assignment

Parallel

Other design features

Two-arm parallel randomized controlled trial comparing upper trapezius myofascial release alone versus upper trapezius myofascial release combined with diaphragm manual release in patients with chronic mechanical neck pain. Treatment will be provided three times per week for four weeks.

Health conditions studied

1

Description of health condition studied

Chronic Mechanical Neck Pain

ICD-10 code

M54.2

ICD-10 code description

Cervicalgia

Primary outcomes

1

Description

Pain Intensity

Timepoint

Before intervention and immediately after completion of the 4-week treatment program.

Method of measurement

Numeric Pain Rating Scale (NPRS), 0–10 scale.

2

Description

Neck Disability

Timepoint

Before intervention and immediately after completion of the 4-week treatment program.

Method of measurement

Neck Disability Index (NDI).

Secondary outcomes

1

Description

Pain Pressure Threshold (PPT)

Timepoint

Before intervention and immediately after completion of the 4-week treatment program.

Method of measurement

Measured using a digital pressure algometer over the upper trapezius trigger point (kg/cm²).

2

Description

Cervical Range of Motion (ROM)

Timepoint

Before intervention and immediately after completion of the 4-week treatment program.

Method of measurement

Measured using an inclinometer for cervical flexion, extension, lateral flexion, and rotation (degrees).

3

Description

Chest Expansion

Timepoint

Before intervention and immediately after completion of the 4-week treatment program.

Method of measurement

Measured using a tape measure at the xiphoid level during maximum inspiration and expiration (cm).

4

Description

Patient Global Impression of Change (PGIC)

Timepoint

Immediately after completion of the 4-week treatment program.

Method of measurement

Measured using the 7-point Patient Global Impression of Change (PGIC) scale.

Intervention groups

1

Description

Control group: Participants will receive upper trapezius myofascial release only, three sessions per week for four weeks. Each session will last approximately 15 minutes.

Category

Treatment - Other

2

Description

Intervention group: Participants will receive upper trapezius myofascial release combined with diaphragm manual release, three sessions per week for four weeks.

Each session will last approximately 25 minutes.

Title and more details about the data/document

De-identified participant dataset, study protocol, statistical analysis results, and informed consent template related to the trial evaluating diaphragm manual release combined with upper trapezius myofascial release in patients with chronic mechanical neck pain.

When the data will become available and for how long

Data and supporting documents will be available upon reasonable request beginning 6 months after publication of the study results and will remain available for 5 years.

To whom data/document is available

De-identified data and study documents will be available to qualified researchers, clinicians, and academic investigators conducting scientific research.

Under which criteria data/document could be used

Data may be used for scientific research, secondary analyses, systematic reviews, and meta-analyses following approval of a reasonable research proposal.

From where data/document is obtainable

Requests should be sent by email to the principal

investigator, Mohammed Basim Mohammed Alkhafajy, at the corresponding study email address.

What processes are involved for a request to access data/document

Researchers must submit a written request describing

the purpose of data use. Requests will be reviewed by the principal investigator, and approved applicants will receive access to de-identified data.
