Comparing the effect of scapular stabilization exercises with neck stabilization exercises with feedback on pain, posture, muscle electromyography activity in people with forward head deformity and non-specific chronic neck pain.

Protocol summary

Study aim

Compare the effects of scapular versus neck stabilization exercises on pain, posture, and electromyographic muscle activity in individuals with forward head posture and chronic non-specific neck pain.

Design

Design & Sample: A simple randomized, non-blinded, phase 0 clinical trial with two intervention groups and one control group. It includes 36 females (aged 20–30) with mild-to-moderate chronic neck pain and forward head posture. Randomization will be performed using the Excel RAND function.

Settings and conduct

Conducted at Shahid Beheshti University, this study involves 36 females with mild-to-moderate neck pain and forward head posture. Interventions comprise 4 weeks of scapular or neck stabilization exercises (3 sessions/week, 40–50 min/session). Outcomes include pain (VAS), forward head angle (photogrammetry), and superficial muscle activity (sEMG).

Participants/Inclusion and exclusion criteria

Inclusion Criteria: Forward head angle 35–50°; BMI 18–25 kg/m²; mild-to-moderate chronic neck pain; no regular exercise in past 6 months; no history of surgery; not pregnant. Exclusion Criteria: Outside age range; unwillingness to participate; active limb or musculoskeletal injuries.

Intervention groups

The study includes two intervention groups performing either scapular or neck stabilization exercises (4 weeks, 3 sessions/week, 40–50 minutes/session). The control group will receive no intervention and maintain their usual daily activities.

Main outcome variables

Neck pain intensity; forward head posture angle; onset time and amplitude of superficial neck and scapular

muscle electromyographic activity

Scientific title

Comparing the effect of scapular stabilization exercises with neck stabilization exercises with feedback on pain, posture, muscle electromyography activity in people with forward head deformity and non-specific chronic neck pain.

Public title

Comparison of the Effects of Scapular and Cervical Stabilizing Exercises in Individuals with Forward Head Posture and Neck Pain

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

forward head angle greater than 35 degrees and less than 50 degrees), Body Mass Index (BMI) of 18 to 25, Mild to moderate neck pain (3 to 7 on the VAS scale) No history of athletic activity in the past six months No history of surgery, injury, accident, fracture, or significant abnormalities in the upper extremity. Absence of pregnancy

Exclusion criteria:

Older and younger ages Presence of injury in body organs

Age

From **20 years** old to **30 years** old

Gender

Female

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: **36**

Randomization (investigator's opinion)

Randomized

Randomization description

In this study, simple randomization method is used and the randomization unit is "individual". Random sequence is generated in Excel software using RAND function and MOD ROW function is used for grouping. In order to observe allocation concealment, each individual's allocation code is placed in illegible and sealed envelopes after being determined in Excel.

Blinding (investigator's opinion)

Not blinded

ICD-10 code description

Cervicalgia

Primary outcomes

1

Description

Measuring pain levels

Timepoint

Before the start of the intervention and four weeks later

Method of measurement

Participants will be asked to respond using the Visual Analog Scale (VAS), which rates pain intensity on a scale of 0 to 10. A score of 1-3 indicates mild pain, 4-7 indicates moderate pain, and 8-10 indicates severe pain.

2

Description

Measurement of forward head angle

Timepoint

Before the start of the intervention and four weeks later

Method of measurement

The participant will be asked to stand in a relaxed position and gaze at an imaginary point directly ahead. The examiner will then take a side-view photograph from a distance of 150 cm, following a five-second pause.

Subsequently, using online protractor software, the angle between the line passing through the spinous process of the seventh cervical vertebra and the tragus, and the line passing horizontally through the spinous process of the seventh cervical vertebra (the cranio-vertebral angle), will be measured.

3

Description

electromyography (sEMG)

Timepoint

Before the start of the intervention and four weeks later

Method of measurement

Surface electromyography (sEMG) of the dominant side upper/middle/lower trapezius, sternocleidomastoid, serratus anterior, and middle deltoid was recorded using Megawin software and analyzed via MATLAB. Electrode placement followed the SENIAM protocol and reference literature. For data normalization, Maximum Voluntary Isometric Contraction (MVIC) was performed in muscle-specific positions using three 5-second trials separated by standardized rest intervals to prevent fatigue, utilizing the middle 3 seconds for analysis. Participants performed 5 repetitions of controlled-speed scaption, and signals from the middle 3 repetitions were band-pass filtered (20-450 Hz), rectified, and normalized to MVIC to calculate muscle onset time and activation amplitude

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: Scapular stabilization exercises will be performed for four weeks, three sessions per week, lasting 40–50 minutes per session. Outcome measures include pain intensity via the Visual Analog Scale (VAS), forward head posture angle via photogrammetry, and superficial muscle activity via surface electromyography (sEMG).

Category

Rehabilitation

2

Description

Intervention group: Neck stabilization exercises will be performed for four weeks, three sessions per week, lasting 40–50 minutes per session. Outcome measures include pain intensity via the Visual Analog Scale (VAS), forward head posture angle via photogrammetry, and superficial muscle activity via surface electromyography (sEMG).

Category

Rehabilitation

3

Description

Control group: During the study period, no intervention will be administered to the control group, and participants will continue their usual exercises. Additionally, the VAS scale will be used to measure pain levels, photogrammetry to assess forward head angle, and EMG equipment to measure superficial muscle activity.
