Effects of National Academy of Sports Medicine (NASM)-Based Corrective Exercises and Knee-Focused Neuromuscular Training on Return-to-Sport Tests and Lower Limb Muscle Electrical Activity in Young Volleyball Players Following Anterior Cruciate Ligament Reconstruction

Protocol summary

Study aim

Effects of National Academy of Sports Medicine (NASM)-Based Corrective Exercise and Knee-Oriented Neuromuscular Training on Return-to-Sport Performance and Lower Extremity Muscle Activity in Young Volleyball Athletes After ACL Reconstruction

Design

A randomized clinical study, single-blind, parallel-group, 45 elderly randomized to 2 intervention groups and a control group through web-based randomization

Settings and conduct

Following physician evaluation and eligibility screening, participants provided written consent and were assigned to either an intervention or control group. In this single-blind study, the outcome assessor was unaware of group allocation. The 8-week program (three 60-min sessions/week) was conducted at Kharazmi University's Movement Analysis Laboratory

Participants/Inclusion and exclusion criteria

Inclusion Criteria: Being within the age range of 18 to 30 years. Having a history of unilateral anterior cruciate ligament (ACL) . At least 6 months and at most 24 months having passed since the ACL reconstruction surgery. Absence of severe pain, acute inflammation, or significant range of motion limitation at the time of testing. Having adequate functional range of motion of the knee joint, particularly full functional flexion and extension. Exclusion Criteria: Bilateral ACL reconstruction or a history of ACL rupture in the contralateral limb; or meniscal tear requiring recent intervention. History of other knee surgery within the past 6 months; recent arthroscopy; or active pain/swelling that prevents participation in exercises. Neurological, cardiovascular, or metabolic diseases

Intervention groups

Group 1: NASM corrective exercises (3 sessions per week

for 8 weeks). Group 2: Knee-focused neuromuscular training (3 sessions per week for 8 weeks). Control group: No training.

Main outcome variables

Lower limb muscle Electromyography, Return-to-sport functional tests

Scientific title

Effects of National Academy of Sports Medicine (NASM)-Based Corrective Exercises and Knee-Focused Neuromuscular Training on Return-to-Sport Tests and Lower Limb Muscle Electrical Activity in Young Volleyball Players Following Anterior Cruciate Ligament Reconstruction

Public title

Comparison of the Effects of Corrective Exercises and Neuromuscular Exercises on Lower Limb Function and Muscle Activity in Young Volleyball Players Following ACL Reconstruction

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

Being male and within the age range of 18 to 30 years
Having a history of unilateral anterior cruciate ligament (ACL) reconstruction using the standard surgical technique. At least 6 months and at most 24 months having passed since the anterior cruciate ligament reconstruction surgery. Completion of the initial phase of medical rehabilitation and receiving clearance from a specialist physician to participate in sports activities. Absence of severe pain, acute inflammation, or significant range of motion limitation at the time of testing. Ability to perform single-leg landing tasks and return-to-sport tests without severe pain or a strong feeling of instability. Having adequate functional range of motion of the knee joint, particularly full functional flexion and extension.

Exclusion criteria:

Bilateral ACL reconstruction or a history of ACL rupture in the contralateral limb; or meniscal tear requiring recent intervention. History of other knee surgery within the past 6 months; recent arthroscopy; or active pain/swelling that prevents participation in exercises. Neurological, cardiovascular, or metabolic diseases that affect exercise performance (as diagnosed by a physician). Active knee instability on clinical examination, or severe kinesiophobia that makes task performance impossible. Use of medications affecting neuromuscular function that cause rapid changes.

Randomization (investigator's opinion)

Randomized

Randomization description

In this study, simple randomization was used to assign participants to three groups (two intervention groups and one control group). The randomization sequence was generated using SPSS statistical software and sealed envelopes were used to ensure allocation concealment. Thus, there was no bias or side effects in the group allocation process. How to create a random sequence: A list of numbers from 1 to 45 (the total number of participants) is prepared. Using a randomization tool (such as random.org or a random number table), each number is completely randomly assigned to one of three groups (A: intervention 1, B: intervention 2, C: control). Result: A random sequence such as [A, C, B, A, B, C, ...] up to 45 people. How subjects are entered: Participants are entered in the order they register (first, second, etc.). Each person is assigned based on their position in the sequence (e.g., person 1 to A, person 2 to C, etc.). To ensure concealment, the sequence is placed in sealed envelopes and opened sequentially.

Blinding (investigator's opinion)

Single blinded

Blinding description

In this study, the outcome assessor is blind to the groups' randomization and interventions receiving by participants. In this way, during the evaluation before and after the intervention protocol, they do not make mistakes in their judgments in favor of a specific therapeutic intervention.

Health conditions studied

1

Description of health condition studied

anterior cruciate ligament Injury

ICD-10 code

S83.5

ICD-10 code description

Sprain of cruciate ligament of knee

Primary outcomes

1

Description

Lower limb muscle Electromyography

Timepoint

Beginning and end of exercises duration

Method of measurement

Electromyography device

Secondary outcomes

1

Description

Return-to-sport functional tests

Timepoint

Before and after exercise protocols

Method of measurement

Single leg hop for distance, Crossover hop for distance, 6-m timed hop ,Triple hop for distance

Intervention groups

1

Description

Intervention group 1: The National Academy of Sports Medicine (NASM) training group participated in an 8-week program, with three sessions per week. Each session included foam rolling for muscle inhibition, static and dynamic stretching, isolated strengthening of underactive muscles using resistance exercises, and full-body functional movements to coordinate movement patterns

Category

Rehabilitation

2

Description

Intervention group: The knee-focused neuromuscular training program was conducted for 8 weeks, with three sessions per week. The emphasis was on dynamic joint stabilization, anticipatory muscle activation, and reactive motor control. Each session included a dynamic warm-up, balance and perturbation exercises on stable

and unstable surfaces, plyometric and landing retraining with visual and verbal feedback, and agility drills involving directional changes and responses to stimuli

Category

Rehabilitation

3

Description

Control group: This group did not receive any training or intervention during the study period.
