Effect of narrow band UVB phototherapy plus betamethasone ointment versus narrow band UVB phototherapy plus placebo ointment on the treatment of vitiligo: a double blinded randomized clinical trial

Protocol summary

Summary

Objectives: To assess the effect of narrow band UVB phototherapy plus betamethasone ointment versus narrow band UVB phototherapy plus placebo ointment on the treatment of vitiligo. Design: A double blinded randomized clinical trial. Setting and conduct: All eligible patients with vitiligo who will refer to clinic of Farshchian Hospital during the study period will be enrolled in to the trial. Inclusion criteria: (a) age of 7 years or older; (b) having bilateral symmetrical vitiligo lesions on upper or lower limbs, face, or trunk; (c) the vitiligo is either stable or progressive; (d) at least 10% of the body surface is affected by the disease. Exclusion criteria: (a) being immunodeficient; (b) being spontaneous repigmentation; (c) having any contraindications for phototherapy. Intervention: Narrow band UVB phototherapy thrice a week plus betamethasone ointment twice a day for three months. Control: Narrow band UVB phototherapy thrice a week plus placebo (eucerin) ointment twice a day for three months. Primary outcome: Repigmentation of the lesion based on VASI criteria in the sixth and twelfth weeks. Secondary outcome: Evaluation of probable superficial burn through clinical observation weekly before phototherapy.

Randomization (investigator's opinion)

Randomized

Randomization description

Blinding (investigator's opinion)

Double blinded

Blinding description

Placebo

Used

Assignment

Parallel

Other design features

Randomization: Two symmetrical lesions on either side of each patient are randomly selected, one as intervention and the other as control. Thus, each patient will be compared with oneself. Blinding: The patients will receive ointment with the same shape but different content. Thus, they will not aware of the intervention. The photos will be taken from the lesions in the sixth and twelfth weeks. Then the photos will be evaluated and compared with each other by a physician who is not aware of the intervention. Thus, the design of the study will be double blinded.

Description of health condition studied

Vitiligo

ICD-10 code

L80

ICD-10 code description

Vitiligo

Primary outcomes

1

Description

Repigmentation of the lesion

Timepoint

at the sixth and twelfth weeks

Method of measurement

based on VASI criteria

Secondary outcomes

1

Description

Evaluation of probable superficial burn

Timepoint

weekly before phototherapy

Method of measurement

through clinical observation

Intervention groups

1

Description

Narrow band UVB phototherapy thrice a week plus
betamethasone ointment twice a day for three months.

Category

Treatment - Drugs

2

Description

Narrow band UVB phototherapy thrice a week plus
placebo (eucerin) ointment twice a day for three months.

Category

Placebo
